Universal CMM for quick and easy measurement

The search for excellence is the philosophy which has led us to the development of the Micro-Hite 3D Dual, based on the technologies that have widely contributed to the success of all TESA Systems.

This new machine opens up a new path in the field of tactile three-axis measurement, offering the motorised reproduction of manual displacements, without any preliminary programming. It is now possible to store a sequence of measurements, and have it repeated very precisely and under the same conditions on a series of parts (part after part or on a pallet) for increasing productivity and throughput easily.

This machine offers the benefit of the simplicity of a manual CMM software combined with the flexibility that a fully automated measuring cycle provides. It's user-friendliness and powerful capabilities are real advantages in the hand of everyone.
